

Data Governance Plan — RCM Operational Analytics: Executive Scorecard

Executive Summary

This document defines the data governance framework for the RCM Operational Analytics - Executive Scorecard dashboard. It describes scope, objectives, roles, policies, implementation approach, milestones, and acceptance criteria so the team can align on governance, compliance, and operational responsibilities.

Objectives

- Ensure data quality, lineage, and discoverability for dashboard artifacts.
- Define ownership and stewardship for code, datasets, and reports.
- Enforce least-privilege access and policy checks in Microsoft Fabric and Purview.
- Integrate governance into CI/CD to prevent drift and ensure auditability.

Scope

Included:

- Repository code and configuration for the Executive Scorecard
 - Power BI reports / report definitions (if stored in repo)
 - Notebooks, pipelines, transformation scripts used to build datasets
 - Deployment manifests / CI-CD pipelines that publish artifacts
- Excluded (unless otherwise agreed):
- Downstream systems not referenced by the repo
 - Third-party data sources outside managed contracts

Roles & Responsibilities

- Project Sponsor: Stakeholder-owner accountable for outcomes.
- Data Steward: Responsible for dataset classification, metadata, and approvals.
- Code Owner / Repo Maintainer: Responsible for code reviews and CI policy enforcement.
- Platform Admin: Configure Fabric workspaces, Purview integration, RBAC, and monitoring.

- Security/Compliance: Review policies and audit results periodically.

Key Policies (Draft)

- Ownership: Every dataset, report, and pipeline must have an assigned owner and a steward.
- Classification & Labels: Apply sensitivity and business classification tags (e.g., Public, Internal, Confidential, PHI) to datasets and reports.
- Access Control: Enforce RBAC in Fabric workspaces; use groups for role assignments; approve access via steward workflows.
- Lineage & Cataloging: Register datasets, notebooks, and reports in Purview; capture automated lineage from pipelines and reporting assets.
- CI/CD Checks: Block merges that fail policy checks (missing labels, missing owner, failing unit-tests, or missing lineage metadata).
- Retention & Archival: Define retention windows and archival procedures per dataset classification.

Implementation Approach

1. Inventory: Identify all artifacts in the repo and map which Fabric workspace assets they relate to.
2. Classification: Assign initial classifications and owners to artifacts; document in a metadata file (e.g., GOVERNANCE_METADATA.md) and register key datasets in Purview.
3. Policy Definition: Finalize classification labels, approval flows, and CI gating rules.
4. Automation: Integrate metadata checks into CI (pre-merge), enable automated lineage capture, and configure workspace RBAC templates.
5. Pilot: Apply governance to a small set of critical artifacts (e.g., top 3 dashboards/datasets), validate, and refine.
6. Rollout: Expand to remaining assets, provide training, and hand over operational runbook.

Deliverables

- Governance policy document (this file)
- GOVERNANCE_METADATA.md mapping artifacts → owners → classification
- CI policy checks (scripts/workflow) blocking policy violations
- Purview registrations and lineage for pilot artifacts
- Runbook: owner contacts, onboarding steps, and audit checklist

Milestones & Timeline (Example)

- Week 0: Kickoff, confirm scope and stakeholders
- Week 1: Inventory and assign owners (pilot artifacts)
- Week 2: Draft policies and CI check prototypes
- Week 3: Implement pilot automation and register lineage in Purview
- Week 4: Pilot validation, adjustments, and team training
- Week 5+: Rollout across remaining artifacts

Acceptance Criteria

- Pilot artifacts registered in Purview with lineage captured.
- All pilot artifacts have assigned owners and classifications recorded.
- CI pipeline blocks merges that violate core governance policies.
- RBAC configured in workspaces to enforce least-privilege for pilot artifacts.

Communications & Meetings

- Weekly 30-min sync during pilot phase: progress, blockers, actions.
- Ad-hoc review sessions for policy sign-off with Security/Compliance.
- Slack/Teams channel for day-to-day coordination and escalation.

Risks & Mitigations

- Risk: Incomplete inventory misses artifacts. Mitigation: cross-check with Fabric workspace and run automated scans of repo.
- Risk: Resistance to new CI gating. Mitigation: provide clear rollback and exception workflows; start with soft enforcement (warnings) then hard block.

Next Steps (Immediate)

1. Review this document with stakeholders and confirm scope.
2. Approve pilot artifact list (3 artifacts recommended).
3. Assign owners and stewards for pilot artifacts.
4. Start the inventory and Purview registration for pilot.
